FI & AAL : Localised and Assisted on the Move

This use case illustrates some future assistance services for elderly   persons, [look](#) supported by indoor localization technologies and   context-aware applications. The indicated features and services are at   the core of Ambient Assisted Living in general,
[cheap](#)
 and will therefore,   after following a user-centered design approach, serve as source of generic and AAL-specific requirements for the Future Internet. Private   and public spaces like home and supermarkets will serve as AAL platforms   and can thus provide added value services. The use case highlights the   commonalities between the different spaces and the seamless service   provision expected from the Future Internet based society when moving from one AAL space to another.
